Department of Microbiology
Soft skill course- Laboratory skills and Microbiology

The laboratory skills programme is designed and delivered by real scientists to provide science students with an opportunity to gain hands on experience using real laboratory equipment. This course is frequently attended by undergraduates studying students who need some additional laboratory skills before starting an honor's project.

The course is often also attended by undergraduates who wish to gain a better understanding of laboratory procedure before making an application for post graduate study.

The laboratory skills programme runs from 9:30am – 4pm for 5 consecutive days and provides practical laboratory based training delivered by Microbiology faculties.

We teach at a very low student to tutor ratio meaning that students are supervised and encouraged throughout their course. We ask students to design their own experiments and allow students to make (safe) mistakes and learn from these. We believe this helps students to develop independent research skills and gain confidence in their own ability in the laboratory.

Days	Content
Day 1 - Laboratory Introduction:	<ul style="list-style-type: none"> ❖ Laboratory Health and Safety including Risk Assessments and COSHH ❖ Pipetting ❖ Balances ❖ Molar equations ❖ pH meters ❖ Plate readers ❖ Data analysis including standard curves ❖ Laboratory note book maintenance ❖ Laboratory maintenance
Day 2	<ul style="list-style-type: none"> ❖ Students learn aseptic technique, working with Microorganism. ❖ To perform some staining procedures with principals.
Day 3	<ul style="list-style-type: none"> ❖ Investigate bacteria in environmental samples. During these days students will become more autonomous in their work, autoclaving their own media and biohazard waste, and troubleshooting their experimental designs.
Day 4 Nano-Toxicology	To perform the skills they learned on 3 days to investigate the effect of toxic nano-materials on living things.

Day 5 - Career
Development
Workshop, Student
Presentations and
Certifications:

1. Career Development Workshop

- ❖ Students will learn about the many internship and funding opportunities available to undergraduate science students. This will allow students to build on laboratory experience gained during this residential course and further their scientific careers.

2. Student Presentations

At the end of the course students will present one of their experiments to the rest of the group in a formal presentation session. The audience will be able to ask questions and provide an opportunity for students to show what they have learned during the course of the week.

Soft skill course in 'BIOINFORMATICS'
Academic Year 2022-2023**

The first definition of the term bioinformatics was coined by Paulien Hogeweg and Ben Hesper in 1970, to refer to the study of information processes in biotic systems. This definition placed bioinformatics as a field parallel to biochemistry (the study of chemical processes in biological systems).

Bioinformatics and computational biology involved the analysis of biological data, particularly DNA, RNA, and protein sequences. The field of bioinformatics experienced explosive growth starting in the mid-1990s, driven largely by the Human Genome Project and by rapid advances in DNA sequencing technology.

Analyzing biological data to produce meaningful information involves writing and running software programs that use algorithms from graph theory, artificial intelligence, soft computing, data mining, image processing, and computer simulation. The algorithms in turn depend on theoretical foundations such as discrete mathematics, control theory, system theory, information theory, and statistics.

GOAL— In order to study how normal cellular activities are altered in different disease states, raw biological data must be combined to form a comprehensive picture of these activities. Therefore, the field of bioinformatics has evolved such that the most pressing task now involves the analysis and interpretation of various types of data. This also includes nucleotide and amino acid sequences, protein domains, and protein structures.

Important sub-disciplines within bioinformatics and computational biology include:

Development and implementation of computer programs to efficiently access, manage, and use various types of information.

Development of new mathematical algorithms and statistical measures to assess relationships among members of large data sets. For example, there are methods to locate a gene within a sequence, to predict protein structure and/or function, and to cluster protein sequences into families of related sequences.

The primary goal of bioinformatics is to increase the understanding of biological processes. What sets it apart from other approaches is its focus on developing and applying computationally intensive techniques to achieve this goal. Examples include: pattern recognition, data mining, machine learning algorithms, and visualization. Major research efforts in the field include sequence alignment, gene finding, genome assembly, drug design, drug discovery, protein structure alignment, protein structure prediction, prediction of gene expression and protein-protein interactions, genome-wide association studies, the modeling of evolution and cell division/mitosis.

Bioinformatics entails the creation and advancement of databases, algorithms, computational and statistical techniques, and theory to solve formal and practical problems arising from the management and analysis of biological data.

Over the past few decades, rapid developments in genomic and other molecular research technologies and developments in information technologies have combined to produce a tremendous amount of information related to molecular biology. Bioinformatics is the name given to these mathematical and computing approaches used to glean understanding of biological processes.

Common activities in bioinformatics include mapping and analyzing DNA and protein sequences, aligning DNA and protein sequences to compare them, and creating and viewing 3-D models of protein structures.

Detail Syllabus

Title	Lecture	Notational period
1.1) Introduction – -Definition, aims, tasks and applications of Bioinformatics. Database, tools and their uses – Importance, Types and classification of databases	08	30
1.2) Nucleic acid sequence databases- EMBL, DDBJ, GenBank, GSDB, Ensembl and specialized Genomic resources.	08	
1.3) Protein sequence databases-PIR, SWISS-PROT, TrEMBL, NRL-3D. Protein structure databases SCOP, CATH, PROSITE, PRINTS and BLOCKS. KEGG.	08
